MOP Connection: Kinematic Graphing: sublevels 5-8 (and some of sublevels 9-11)

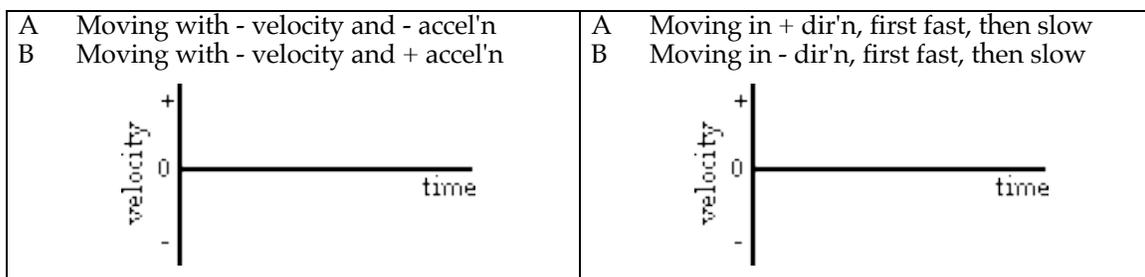

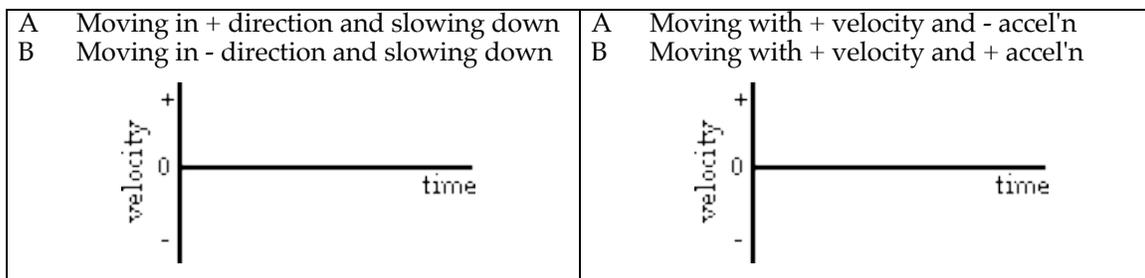

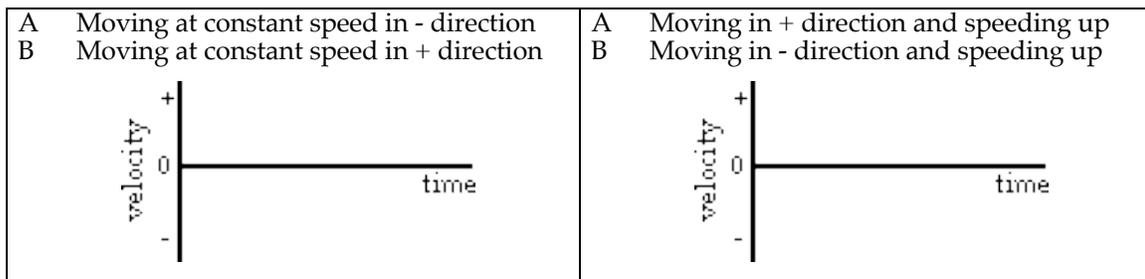

Motion can be described using words, diagrams, numerical information, equations, and graphs. Describing motion with graphs involves representing how a quantity such as the object's velocity = changes with respect to the time. The key to using velocity-time graphs is knowing that the slope of a velocity-time graph represents the object's acceleration and the area represents the displacement.

Review:

1. Categorize the following motions as being either examples of + or - acceleration.
 - a. Moving in the + direction and speeding up (getting faster) _____
 - b. Moving in the + direction and slowing down (getting slower) _____
 - c. Moving in the - direction and speeding up (getting faster) _____
 - d. Moving in the - direction and slowing down (getting slower) _____

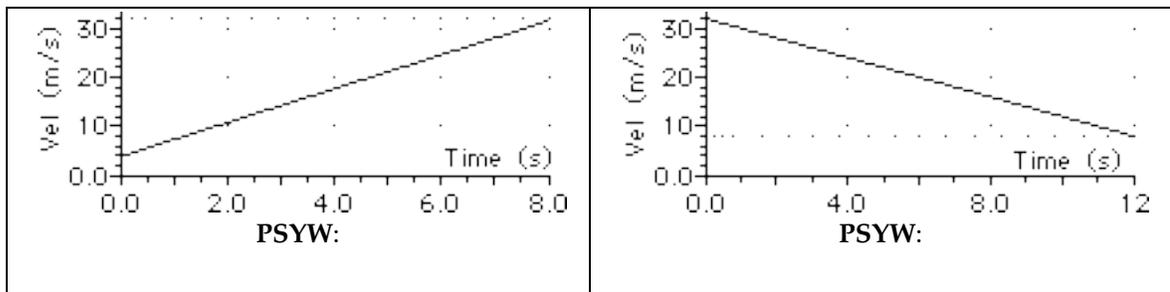

Interpreting Velocity-Graphs

2. On the graphs below, draw two lines/curves to represent the given verbal descriptions; label the lines/curves as A or B.

1-D Kinematics

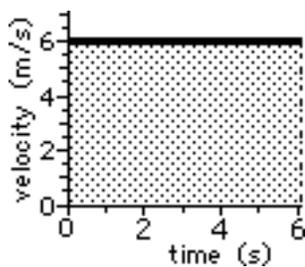

3. Use the velocity-time graphs below to determine the acceleration. **PSYW**

4. The area under the line of a velocity-time graph can be calculated using simple rectangle and triangle equations. The graphs below are examples:

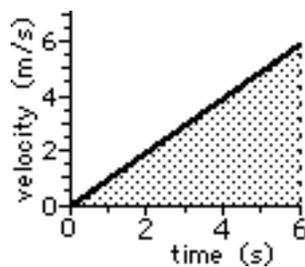

If the area under the line forms a ...

... **rectangle**, then use
area = base*height

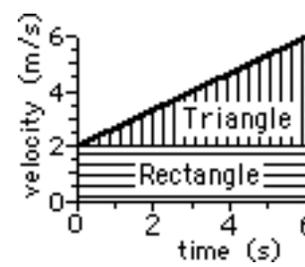

$$A = (6 \text{ m/s}) \cdot (6 \text{ s}) = 36 \text{ m}$$

... **triangle**, then use
area = 0.5 * base*height

$$A = 0.5 \cdot (6 \text{ m/s}) \cdot (6 \text{ s}) = 18 \text{ m}$$

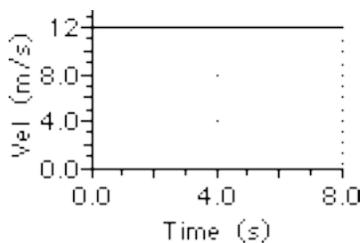

... **trapezoid**, then make it into
a rectangle + triangle
and add the two areas.

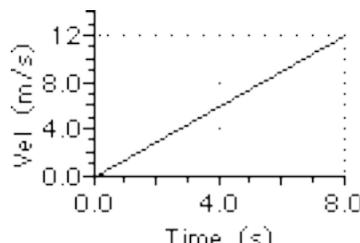

$$A_{\text{total}} = A_{\text{rectangle}} + A_{\text{triangle}}$$

$$A_{\text{total}} = (2 \text{ m/s}) \cdot (6 \text{ s}) + 0.5 \cdot (4 \text{ m/s}) \cdot (6 \text{ s}) = 24 \text{ m}$$

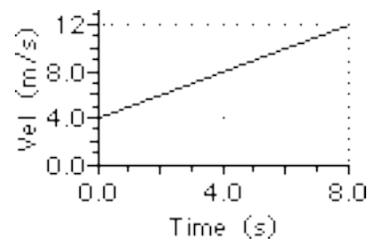

Find the displacement of the objects represented by the following velocity-time graphs.
